Default (GPT-3.5)

```
print(f"Last working day of {i} month(s) ago: {day}")
```

In this example, the ``last_working_day_of_past_months`` function calculates the last working day of each of the past ``months`` months, starting from the current month. It takes into account weekends (Saturday and Sunday) and moves to the previous day if the last day of the month falls on a weekend.

You can adjust the ``past_months`` variable to specify how many past months you want to calculate the last working days for.

how to access yaml member when it's dictionary

To access a member of a YAML dictionary, you can use Python's regular dictionary indexing syntax. When you load a YAML file into a Python dictionary using a library like PyYAML, you can access
